

## Girls' Day at ERICH JAEGER

On 28 March, ERICH JAEGER in Friedberg welcomed two girls of 13 years for the Girls' Day 2019.

The Girls' Day is an event organized by different German ministries and institutions with the aim to raise the interest of girls in technical and scientific occupations. To achieve this, companies working in this field are inviting girls from the 5th grade upwards to gain experience on what such an occupation might include.

After a short introduction about the company, the two girls at ERICH JAEGER in Friedberg visited the different development departments to get a taste about the daily business of the technical employees.

In the components department, Sarper Caliskan showed them the possibilities and functionalities of the CAD designer tool. Together, they designed a case for their smart phones which was printed out on a 3D printer afterwards.

Benjamin Hieke from RD2 took the girls to the garage to install a wiring harness into a car. With the help of the installation instructions, they figured out the various necessary work steps. After the installation, the girls went back to the offices to catch a glimpse on how the instruction manuals are created.

In the Electronics department, the girls got the chance to work on a circuit board with a soldering iron. As a result of their work, the girls could take home a small circuit board with an LED, which they attached themselves.
